Summary

Frontend-focused full-stack software engineer with experience building and debugging AI-powered applications across React, TypeScript, Python, Django, PostgreSQL, and Docker-based environments. Experienced in cross-stack debugging, API workflows, testing, and improving reliability within AI-assisted engineering systems. Passionate about collaborative engineering environments, scalable systems, and continuous learning.

Education

Coding Temple (Bootcamp)

Remote • Sept 2023-Jan 2024

Software Engineering

Experience

Gentle Sprout (Project)

Remote

Software Engineer

- Built and iterated on a full-stack AI-powered conversational application using React Native, Django, Firebase, PostgreSQL, and OpenAI APIs to support structured, context-aware mental health interactions.
- Increased conversational flexibility and contextual response quality by transitioning from rigid fine-tuned JSONL workflows toward a retrieval-inspired architecture designed to reduce repetitive and overly static AI responses.
- Implemented AI-assisted chatbot pipelines integrating OpenAI APIs, Google Text-to-Speech (TTS), and Speech-to-Text functionality to support real-time conversational voice and text experiences.
- Developed backend API workflows and full-stack service integrations using Django, Node.js tooling, Firebase, and PostgreSQL for conversational message processing and contextual AI response generation.
- Designed structured dialogue datasets, DBT-oriented response mappings, emotional context systems, and prompt workflows to support more dynamic, context-aware AI interactions.
- Improved application stability, reliability, and maintainability by debugging frontend/backend integration issues and refining conversational API workflows.
- Integrated frontend, backend, database, and AI-processing workflows including prompt pipelines, state management, API communication, and conversational response systems within a full-stack mobile application.

Outlier AI

Remote

Software Engineer – AI Systems Evaluation

May 2025-Present

- Improved reliability and implementation accuracy across AI-generated full-stack applications by debugging and refining React, JavaScript/TypeScript, Python, and C++ code within Docker-based engineering environments.
- Reduced implementation failures and uncovered edge cases by executing structured testing workflows involving parsing logic, execution scripts, patch validation, and automated engineering pipelines.
- Increased application stability and maintainability by resolving runtime issues, frontend/backend integration bugs, state management failures, and inconsistent system behavior across evolving codebases.
- Worked within structured AI-assisted engineering workflows to validate generated applications against evolving technical specifications while identifying logic, architecture, and performance issues.
- Improved implementation consistency across ambiguous engineering scenarios by troubleshooting API behavior, asynchronous operations, UI interaction failures, and cross-stack data flow issues.
- Supported large-scale engineering evaluation workflows involving Docker execution environments, automated validation systems, debugging pipelines, and implementation refinement across multiple programming languages.

- Built responsive React frontend interfaces while working against evolving project requirements, improving usability and cross-device consistency across user-facing workflows.
- Improved component reusability and frontend maintainability by translating UI/UX designs into scalable, user-focused React components with responsive behavior.
- Integrated Firebase Authentication, Firestore, and Hosting into full-stack application workflows, supporting secure user authentication and real-time application functionality.
- Increased frontend responsiveness and cross-device performance through debugging, optimization, and refinement of component rendering behavior and UI interactions.
- Collaborated within Git-based development workflows to implement frontend updates, resolve UI issues, and iterate on usability improvements across shared React codebases.
- Supported full-stack application behavior involving state management, API-style data interactions, and real-time database synchronization across frontend and backend-connected systems.

Skills

- ♥ TypeScript
- ♥ JavaScript (ES6+)
- ♥ Node.js
- ♥ Python
- ♥ React
- ♥ React Native
- ♥ Django
- ♥ PostgreSQL
- ♥ Firebase
- ♥ Docker
- ♥ Tailwind CSS
- ♥ REST APIs
- ♥ OpenAI API's
- ♥ Git
- ♥ CI/CD
- ♥ AWS
- ♥ Testing/Debugging
