PROFILE

Product-minded software engineer building polished, reliable products across full-stack development and applied AI. Experienced owning complex features from architecture through production - translating ambiguous requirements into responsive interfaces, backend services, APIs, cloud data flows, retrieval systems, LLM orchestration, automated evaluation, testing, and performance improvements. Strong at debugging across system boundaries, designing deterministic controls around probabilistic models, and turning technically complex workflows into maintainable products with thoughtful user experiences.

CORE STACK

Frontend React · React Native · Expo · TypeScript · JavaScript	Backend & Data Python · Django · Node.js · Express · Firebase · REST APIs	AI & Retrieval Gemini · RAG · embeddings · vector search · LighTRAG · NanoVectorDB
Infrastructure Docker · Render · AWS · Google Cloud	Quality pytest · Jest · Django tests · regression testing	Systems AI evaluation · prompt contracts · ElevenLabs · Google Cloud TTS

EXPERIENCE

Gentle Sprout | Founding Software Engineer

Present

Remote

- Architected a cross-platform AI application spanning an Expo/React Native client, Node/Express authentication and data services, a Python/Django AI service, and Firebase persistence.
- Engineered a deterministic-first LLM orchestration pipeline with safety screening, conversation-state reconstruction, intent parsing, lexical and vector retrieval, hybrid ranking, response routing, constrained prompt construction, Gemini generation, output validation, and deterministic fallback.
- Implemented retrieval over a 160-record structured corpus using 768-dimensional Gemini embeddings with LighTRAG/NanoVectorDB, plus first-party lexical scoring, vector-similarity thresholds, candidate filtering, and hybrid ranking logic.
- Built a transactional vector-index deployment workflow with temporary builds, integrity verification, manifest generation, atomic swap/rollback behavior, and deploy-blocking verification.
- Added structured LLM-based step evaluation with strict JSON parsing and deterministic fail-closed state transitions; developed regression coverage for ambiguous intent, conversation-state transitions, routing conflicts, and natural-language edge cases.
- Integrated ElevenLabs neural TTS with Google Cloud TTS fallback, voice request gating, playback state, and provider-failure handling; classified Gemini retry/quota failures, hardened cross-user authorization, and diagnosed asynchronous UI state/rendering failures.

Outlier AI | AI Systems Evaluation Engineer (Contract)

May 2025 - Present

Remote

- Design and evaluate benchmark tasks for autonomous AI agents requiring multi-step reasoning, persistent state, memory, and coordinated interaction with multiple tools across simulated software environments.
- Analyze agent trajectories to isolate reasoning, planning, tool-selection, and execution failures; construct corrected reference trajectories and objective scoring criteria that distinguish partial progress from successful end-state completion.
- Develop and repair automated validation logic, including pytest-based verifiers and functional checks, to confirm agent actions produce the required observable system state rather than merely plausible intermediate behavior.
- Debug and repair AI-generated C++ code and software implementations in Dockerized environments by reproducing failures, tracing defects, modifying implementations, and rerunning automated tests to verify correctness.
- Evaluate code-understanding, bug-fixing, feature-implementation, refactoring, and testing tasks; assess instruction following, reliability, tool coordination, and failure recovery across agent-generated solutions.
- Create rigorous evaluation prompts, rubrics, and reference solutions designed to expose edge cases and generate reproducible signals for model-quality assessment.

Cloud Cores | Software Engineer Intern

Jan 2025 - May 2025

Remote

- Built and shipped responsive React and TypeScript interfaces with reusable component patterns, cross-device behavior, and maintainable frontend architecture.
- Integrated Firebase Authentication and Firestore-backed persistence to support authenticated full-stack workflows and durable user data.
- Implemented client-side data flows and asynchronous application behavior connecting React interfaces to backend/cloud services, including loading, state-update, and error-handling paths.
- Investigated frontend performance issues and optimized component rendering behavior to improve interface responsiveness and reduce unnecessary rendering work.
- Debugged defects across UI, state, authentication, and data flows; validated fixes through functional testing and iterative browser-based verification.

EDUCATION

Coding Temple - Software Engineering Bootcamp | Remote | Sept 2023 - Jan 2024
